Now I have all the data needed. Let me compile the full structured report.

Trading Data Insight Report

Prepared for: Senior Manager, Trading Department **Data Period:** 2026-01-01 09:05 to 2026-01-03 15:55 (approximately 2.9 trading days) **Scope Note:** Unless stated otherwise, all figures in this report **exclude flagged (risky) transactions** to ensure analytical integrity. Flagged transaction figures are reported separately in Section 3. A combined view (inclusive of flagged transactions) is referenced where relevant for comparison.

Section 1 — Trading Patterns

1.1 Overall Activity

The database contains **1,000 total transactions** when flagged records are included, and **950 transactions** when restricted to clean data. This implies **50 flagged transactions** represent 5.0% of total activity. Across the clean dataset:

Metric	Value
Total Transactions	950
Buy Volume (shares)	95,250
Sell Volume (shares)	96,700
Buy Dollar Value	\$24,185,736
Sell Dollar Value	\$24,639,622
Net Volume (Buy - Sell)	-1,450 shares
Net Dollar Imbalance	-\$453,886
Tickers Covered	10
Active Traders	21

The portfolio is near-balanced in aggregate, with sell-side activity marginally exceeding buy-side by **1,450 shares** and **\$453,886** in dollar terms — a net sell bias of approximately 1.5% by volume. This is a modest imbalance and does not indicate a structural directional tilt at the

portfolio level, though ticker-level analysis below reveals more pronounced divergences.

1.2 Buy/Sell Balance by Ticker

The table below summarises buy volume, sell volume, and net position (buy minus sell) per ticker across clean transactions:

Ticker	Buy Volume	Sell Volume	Net Position	Direction
AAPL	7,250	9,400	-2,150	Net Sell
AMD	10,700	7,200	+3,500	Net Buy
AMZN	10,500	10,350	+150	Neutral
GOOGL	10,450	8,550	+1,900	Net Buy
INTC	8,600	9,600	-1,000	Net Sell
META	12,850	10,400	+2,450	Net Buy
MSFT	9,000	11,250	-2,250	Net Sell
NFLX	10,850	9,950	+900	Net Buy
NVDA	9,900	9,550	+350	Neutral
TSLA	5,150	10,450	-5,300	Net Sell

TSLA carries the largest net sell position at -5,300 shares, which is notably outsized relative to all other tickers. **MSFT** (-2,250) and **AAPL** (-2,150) also show meaningful net sell pressure. On the buy side, **AMD** (+3,500) and **META** (+2,450) are the most accumulated positions. **AMZN** and **NVDA** are effectively neutral.

1.3 Dollar Value Distribution by Ticker

By total dollar value traded (buys + sells, clean data):

Rank	Ticker	Total Dollar Value
1	NFLX	\$11,438,370
2	NVDA	\$8,857,712
3	MSFT	\$7,131,560
4	META	\$5,762,202
5	TSLA	\$3,843,546
6	AMZN	\$3,642,773
7	AAPL	\$2,911,611
8	GOOGL	\$2,380,900
9	AMD	\$2,221,043
10	INTC	\$635,643

NFLX dominates by dollar value at \$11.4M — representing approximately **23.9% of total clean dollar activity** (\$48.8M combined). **NVDA** follows at \$8.9M (18.2%). Together, NFLX

and NVDA account for **42.1%** of total dollar value. **INTC** is the clear outlier at the low end with only \$635,643 — less than 1.4% of total value — suggesting it is a low-price or low-activity name in this dataset.

1.4 Trader Activity

Transaction counts per trader (clean data) across all 21 traders, including one "unknown" identity:

Rank	Trader	Transactions
1	T004	59
2	T018	58
3	T002	55
4	T012	53
5	T015	53
6	T014	49
7	T019	46
8	T006	47
9	T003	45
10	T011	45
...	...	...
20	T001	38
20	T008	38
—	unknown	29

The most active identified trader is **T004** with 59 transactions, followed by **T018** (58) and **T002** (55). The least active identified traders are **T001** and **T008** at 38 transactions each. The **"unknown"** trader ID accounts for 29 transactions — a non-trivial volume that warrants attention (addressed in Section 3).

The range across identified traders is 38–59 transactions, a spread of 21. This is relatively contained, suggesting no single identified trader is dramatically dominating transaction count.

Section 2 — Concentration Risk

2.1 Ticker Concentration

By dollar value, the top 3 tickers (NFLX, NVDA, MSFT) account for **\$27.4M out of \$48.8M**, or **56.2% of total clean dollar activity** across only 3 of 10 names. The top 5 tickers account for

approximately **72.5%**. This is a moderately concentrated distribution.

INTC's marginal share (1.3%) suggests it may be a legacy or incidental position rather than an actively managed one. Management should confirm whether INTC's low activity is intentional.

By volume, **META** leads buy-side activity at 12,850 shares bought, while **MSFT** leads sell-side at 11,250 shares sold. **TSLA's** sell volume of 10,450 shares against only 5,150 bought is the starkest directional imbalance in the book — a net sell of 5,300 shares that may reflect a deliberate reduction of a TSLA position or a short-building strategy.

2.2 Trader Concentration

With 21 traders executing 950 clean transactions, the average is approximately **45.2 transactions per trader**. The top 5 traders (T004, T018, T002, T012, T015) collectively account for **278 transactions**, or **29.3% of total activity**. This is broadly proportionate and does not indicate extreme concentration among identified traders.

However, the "**unknown**" trader ID (29 transactions) introduces an unquantifiable concentration risk — these transactions cannot be attributed to any individual, making accountability and limit monitoring impossible for that subset.

2.3 Time Window Concentration

The dataset spans approximately 2.9 days (2026-01-01 to 2026-01-03). Hourly transaction counts from the risky data breakdown show individual hours carrying between **14 and 25 transactions**, which is consistent with normal intraday distribution. No single hour appears to dominate overall volume in a structurally anomalous way.

However, as detailed in Section 3, certain off-hours windows (overnight and pre-market hours such as 23:00, 00:00, 03:00, 05:00, 07:00) contain flagged transactions, which raises questions about whether those time windows represent legitimate trading activity.

Section 3 — Unusual Activity

3.1 Flagged Transaction Overview

There are **50 flagged transactions** in total (out of 1,000), broken down by severity as follows:

Risk Level Count % of Flagged % of Total			
High	20	40.0%	2.0%
Medium	16	32.0%	1.6%

Risk Level Count % of Flagged % of Total

Low	14	28.0%	1.4%
-----	----	-------	------

Total	50	100%	5.0%
--------------	-----------	-------------	-------------

The **20 high-risk transactions** are the primary concern and should be reviewed first. Including flagged transactions, total sell volume rises to 104,350 shares (\$26.3M) and buy volume to 98,200 shares (\$24.8M), implying the 50 flagged transactions account for approximately **6,100 additional shares sold** and **2,950 additional shares bought** — a notably sell-skewed composition within the flagged subset itself.

3.2 Risky Transactions by Trader

Twelve of the 21 traders have at least one flagged transaction associated with their ID:

Trader High Medium Low Total Flagged Total Txns Flagged %

T011	6	2	0	8	53	15.1%
T006	4	2	0	6	53	11.3%
T016	4	0	2	6	47	12.8%
T014	2	4	0	6	55	10.9%
T019	2	0	4	6	52	11.5%
T009	2	0	0	2	42	4.8%
T005	0	2	2	4	47	8.5%
T008	0	2	2	4	42	9.5%
T001	0	0	2	2	40	5.0%
T013	0	0	2	2	47	4.3%
T015	0	2	0	2	55	3.6%
T017	0	2	0	2	46	4.3%

T011 is the most concerning individual trader, with **6 high-risk and 2 medium-risk** flagged transactions — 8 total, representing **15.1% of their own activity**. This is the highest flagged rate among all traders and the highest absolute count of high-risk flags. **T006** and **T016** each carry 4 high-risk flags. **T014** has 4 medium-risk flags in addition to 2 high-risk ones, giving it the third-highest total flagged count (6). These four traders — **T011, T006, T016, and T014** — should be prioritised for compliance review.

Nine traders (T002, T003, T004, T007, T010, T012, T018, T020, and unknown) have zero flagged transactions in the risky-by-trader breakdown, though the "unknown" category warrants separate treatment below.

3.3 Unknown Trader ID

The trader ID **"unknown"** appears in 29 transactions across the dataset. This indicates

missing or unrecorded trader attribution for those records. Key concerns:

- These 29 transactions cannot be assigned to any individual for accountability, limit monitoring, or compliance review.
- The "unknown" ID does not appear in the risky-by-trader breakdown, which may mean these transactions are clean — or that the flagging system itself could not associate them with a risk profile.
- Management should investigate the root cause: whether this reflects a system ingestion failure, manual entry bypass, or deliberate obfuscation.

3.4 Risky Transactions by Time Window

Flagged transactions are distributed across 19 distinct hours over the three-day period.

Notable observations:

Off-hours and overnight activity with high-risk flags:

Hour	High	Medium	Low	Total Txns
2026-01-01 19:00	2	4	0	24
2026-01-01 23:00	0	0	0	24
2026-01-02 07:00	0	0	0	24
2026-01-02 15:00	2	0	0	25
2026-01-02 16:00	4	0	0	21
2026-01-02 18:00	0	0	0	25
2026-01-03 00:00	2	0	0	14

The **2026-01-02 16:00** window stands out with **4 high-risk transactions** in a single hour (out of 21 total that hour — a 19% flagged rate). The **2026-01-01 19:00** window has 6 flagged transactions (2 high, 4 medium) out of 24, a 25% flagged rate — the highest concentration of flagged activity in any single hour.

Transactions occurring at **23:00, 00:00, 03:00, 05:00, and 07:00** fall outside standard market hours and should be scrutinised for legitimacy, particularly given that some carry high-risk flags. The **2026-01-03 00:00** window (2 high-risk out of only 14 transactions) represents a 14.3% flagged rate in a low-volume overnight window, which is disproportionate.

Summary and Recommended Actions

Priority	Finding	Recommended Action
Critical	T011 has 6 high-risk and 2 medium-risk	Immediate compliance review of T011's

Priority	Finding	Recommended Action
	flags (15.1% of their activity)	transaction history
High	T006, T016, T014 each have 4–6 flagged transactions including high-risk	Escalate to compliance; review associated tickers and counterparties
High	29 transactions attributed to "unknown" trader ID	Investigate data provenance; enforce mandatory trader ID capture
High	2026-01-01 19:00 and 2026-01-02 16:00 show highest flagged-transaction density	Review all flagged transactions in these windows for pattern or coordination
Medium	Off-hours transactions (23:00, 00:00, 03:00, 05:00, 07:00) with high-risk flags	Confirm whether after-hours trading is authorised; review flagged records
Medium	TSLA net sell position of -5,300 shares is the largest directional imbalance	Confirm this is within mandate and reflects an intentional position reduction
Medium	NFLX + NVDA = 42.1% of total dollar value	Assess whether concentration in two names is within portfolio risk limits
Low	INTC accounts for only 1.3% of dollar value	Confirm whether INTC is an active or legacy position

Report generated using clean transaction data (risky transactions excluded from core analysis unless explicitly noted). All figures are sourced directly from the transaction database covering the period 2026-01-01 to 2026-01-03.
